## [Flatpak 1.3 Brings Support For Multiple NVIDIA GPUs, Sandboxed DConf](#) [2]

The Flatpak 1.3 unstable series has kicked off starting the latest round of feature work to this leading Linux sandboxing / app distribution technology.

Flatpak 1.3.0 is available for testing as the first unstable/development release for what will eventually become Flatpak 1.4. The Flatpak 1.3 release now supports multiple NVIDIA GPUs, support for systems where /var/run is a symlink (e.g. Gentoo), initial support for sandboxed DConf support, and generating the AppStream branch is now much faster on large repositories, among other improvements. There's also the usual assortment of bug fixing and some translation updates in this release.

## [Flatpak 1.3 Arrives with Support for Linux Systems with Multiple Nvidia Devices](#) [3]

Flatpak developer and maintainer Alexander Larsson released a new unstable release of the Linux application sandboxing and distribution framework, targeting the upcoming Flatpak 1.4 stable series.

Flatpak 1.3 is here as the first milestone is a series of unstable releases towards the next major and stable new version of the Linux application sandboxing and distribution framework, Flatpak 1.4, adding several new features and improvements like support for systems with multiple Nvidia devices.

Furthermore, the Flatpak 1.3 release adds initial support for sandboxed dconf, introduces two new options to the build-update-repo command, namely `--no-update-[summary,appstream]` and `--static-delta-ignore-ref=PATTERN`, and improves support for large repositories by making regeneration the appstream branch faster.
