Finally, the next major version of IPFire is ready to testing. We consider our new Intrusion Prevention System such an important change, that we are calling it "IPFire 2.23" from now on. This update also contains a number of other bug fixes and enhancements.

U.S. energy regulators are pursuing a risky plan to share with electric utilities a secret "don't buy" list of foreign technology suppliers, according to multiple sources.

The move reflects the federal government's growing concern that hackers and foreign spies are targeting America's vital energy infrastructure. And it's also raised new questions about the value of top-secret U.S. intelligence if it can't get into the hands of power industry executives who can act on it to avoid high-risk vendors.

Joseph McClelland, director of the Federal Energy Regulatory Commission's Office of Energy Infrastructure Security, told a Department of Energy advisory committee last month that officials are working on "an open-source procurement list" for utilities to use when deciding where to source their software and equipment.
