

Speed Up Gnome Shell On Fedora 30 Using This Copr Repository

There's a Copr repository for Fedora 30 that presumably speeds up Gnome Shell and Mutter by adding some patches. The repository also has builds for Fedora 29, and while they are no longer maintained, they should still work.

Gnome already worked fine on my laptop running Fedora 30, so I can't say from personal experience how big of an impact it makes. You can give it a try, and if you don't notice any improvements, or if it makes things worse, you can easily remove it.
