OpenSUSE Leap 15.1 is significantly better than the first edition. It fixes tons of the problems that the previous version had. But then, it still retains lots of problems and introduces some new ones. You get decent media and phone support, but it's not a perfect record. Network support is average, and overall, the hardware compatibility with the 2010 Pavilion machine is meh.

The installer is no longer as awesome as it used to be, the package management is quite broken, and the system wasn't stable enough to be fun and enjoyable, before or after my tweaks. The Plasma desktop is sweet, and while SUSE does have tricks most other distros don't have, like YaST, BTRFS, Snapper and such, it feels raw and jumbled and hastily put together. There were too many rough edges and errors and application crashes for me to consider this for serious work. Alas, my dream of using openSUSE in my production setup was dashed once again. All in all, Leap 15.1 deserves something like 4/10, a far cry from the legend it used to be. Maybe, maybe one day. But hey, at the current

rate, 15.2 might be quite all right. We shall see.
