Earlier this week, Mozilla released version 68 of the Firefox web browser. Firefox is the default web browser in Fedora, and this update is now available in the official Fedora repositories.

This Firefox release provides a range of bug fixes and enhancements, including:

Better handling when using dark GTK themes (like Adwaita Dark). Previously, running a dark theme may have caused issues where user interface elements on a rendered webpage (like forms) are rendered in the dark theme, on a white background. Firefox 68 resolves these issues. Refer to these two Mozilla bugzilla tickets for more information. The about:addons special page has two new features to keep you safer when installing extensions and themes in Firefox. First is the ability to report security and stability issues with addons directly in the about:addons page. Additionally, about:addons now has a list of secure and stable extensions and themes that have been vetted by the Recommended Extensions program.
