[Re: \[DNG\] EvilGnome](#) [2]

Basically, this doesn't strike me as even a tiny bit interesting. The template of '\$EVILCODE does \$STUFF to your system if you run it' raises the obvious question of 'What about `_not_` running it?' By and large, code doesn't run itself, so failure to answer that 'one interesting question' means the interesting bit got omitted.

[Web server security ? Part 0: How to start](#) [3]

Many server hardening or server security guides directly start with installing software packages and changing some configuration files. This is fine for experienced server administrators. However, people who try to set up their first server hit on problems and most importantly they very likely forget things that aren't covered by such guides.

So, please do not start to set up your first server by blindly following any guide on the internet (including our guides!).

[?Sudo Mastery, 2nd Edition? open for tech review](#) [4]

I need all reviews back by 5 August. This gives me time (if everything goes well) to have the book in print for vBSDCon. Assuming they accept my proposal, that is.
