Network inventory software refers to the online tools, which deal with the hardware and software resources of a network, including the operational issues. Using this type of software, it becomes easier for administrators to know about the infrastructure components and their configuration systems. Also, it helps to keep the physical record of the network assets or equipment smartly. The components can be Firewalls, Routers and Switches, Storage Area Network, DNS, Servers, Load Balancers, SMTP, VPN, and more.
