For Linux- and BSD-based platforms, the Nvidia 440.36 proprietary graphics driver is here to add support for the Nvidia GeForce GTX 1650 SUPER graphics card, which Nvidia claims it's up to 50 percent faster than the original GTX 1650 and up to 2X faster than the previous-generation GTX 1050.

Now BSD and Linux gamers who bought an Nvidia GeForce GTX 1650 SUPER GPU can use it to play games at full performance if they install the Nvidia 440.36 proprietary graphics driver, which is available to download only for 64-bit operating systems from Nvidia.com or via our free software portal [here](#) and [here](#).
