All other desktop CPUs cower in its presence. My mighty Falcon Northwest Talon with its 12-core Ryzen 3900x is weeping in a corner. And don't even get me started on the 'core envy' my own System76 Thelio is feeling right now.

I'm of course referring to the insane 64-core Ryzen Threadripper 3990X from AMD, which can now be loaded up in the newly redesigned Thelio Major Linux PC from System76.

Launching new or upgraded systems day-and-date alongside a major component release like the Ryzen Threadripper 3990X is commonplace in the Windows hardware world, but this is a move that simply delights me to see in the Linux ecosystem.
