Apple's smartphones have Siri. Most Android phones have Google Assistant. And Samsung phones have Bixby. Voice assistant software has become an increasingly common feature for modern smartphones.

But what about Linux phones? While none of the GNU/Linux distributions available for smartphones like the PinePhone or Librem 5 have a voice assistant baked in, these are basically pocket-sized Linux computers. So of course you can install one? and redditor /u/SkippyTheMgnfcnt shows what happens when you get the open source Mycroft up and running on a PinePhone.
