Signal is a popular open source, cross-platform messaging app with an emphasis on privacy and security thanks to end-to-end encryption for all text messages and voice or video calls.

There are versions of Signal available for Android, iOS, Windows, macOS, and Linux. But until recently folks who wanted to use Signal on a Linux phone like the PinePhone had to either load the official Android app using a tool like Anbox, or use a third-party Signal client like Axolotl.

Now developer Omniteck has found a way to bring the official Signal desktop client to smartphones with ARM64 processors running the Mobian Linux distribution.
