Smartphones are basically pocket-sized computers running mobile-friendly operating systems. And folks who want to run a free and open source GNU/Linux distribution on their phones get the advantages of a hackable, customizable OS that can run desktop Linux applications as well as mobile apps.

But the selection of mobile-optimized Linux apps is still rather small, which is why some folks have been using tools like Anbox to run Android applications on Linux phones. But now there's a new work-in-progress alternative to Anbox called WayDroid which offers smoother performance on supported devices.
