The latest version of Sxmo adds a few new features including support for configuring a WiFi hotspot from your phone's Network Menu and support for a proximity lock that automatically locks or unlocks the display based on proximity (so the screen doesn't come on when your phone is in your pocket, for example).

Sxmo 1.5.0 also brings a number of performance and user interface tweaks and some under-the-hood changes. But overall, Sxmo continues to be a simple, speedy user interface for mobile Linux devices. In fact, it's so well optimized that it can make even a low-end smartphone like the PinePhone feel fast.
