Microsoft today pushed software updates to plug dozens of security holes in Windows and related products, including a vulnerability that is already being exploited in active attacks. Also, Apple has issued an emergency update to fix a flaw that's reportedly been abused to install spyware on iOS products, and Google's got a new version of Chrome that tackles two zero-day flaws. Finally, Adobe has released critical security updates for Acrobat, Reader and a slew of other software.

[Apple Patches Up Devices In Response To The Exposure Of Yet Another NSO Group Exploit](#)[8]

Israeli digital arms merchant NSO Group continues to sell its malware to a wide variety of governments. The governments it sells to, which includes a bunch of notorious human rights abusers, continue to use these exploits to target dissidents, activists, journalists, religious leaders, and political opponents. And the manufacturers of the devices exploited by governments to harm people these governments don't like (NSO says "criminals and terrorists," long-term customers say "eh, whoever") continue to patch things up so these exploits no longer work.

[It's not just you: Emergency software patches are on the rise](#) [9]

Researchers raised the alarm Monday about a big one: The Israeli spyware company NSO Group, which sells programs for governments to remotely take over people's smartphones and computers, had figured out a new way into practically any Apple device by sending a fake GIF through iMessage. The only way to guard against it is to install Apple's emergency software update.

[Apple Rushes Out Emergency Update to Stop ?No Click? Spyware](#) [10]

The flaw, disclosed Monday by Citizen Lab, allowed a hacker using NSO's Pegasus malware to gain access to a device owned by an unnamed Saudi activist, according to security researchers. Apple said the flaw could be exploited if a user on a vulnerable device received a ?maliciously crafted? PDF file.
