Essential System Utilities is a series of articles highlighting essential system tools. These are small utilities, useful for system administrators as well as regular users of Linux based systems.

The series examines both graphical and text based open source utilities. For details of all tools in this series, please check the table at the bottom.

This article looks at Pingnoo, an open-source cross-platform application for analysing and measuring the round trip time (latency) between two hosts. It offers a graphical representation for traceroute and ping output.
